

Requirements for Project

- Documentation - Edit the exampleProjectSpecs file I emailed to you on 12/18/17. It is an example project documentation to help get started. Do not worry if you cannot add everything. I can help along the way. However, for us to have a solid foundation, the following project specifications must be defined for the web application:
 - **A one-paragraph description of your project**
 - **Data storage requirements**
 - Sample documents that you will store in your database, and a description of what each document represents
 - **Wireframes ([like this one](#))**
 - [a great article on wireframes](#)
 - I recommend to make them hand-drawn (draw the page, take picture of drawing on phone, send drawings to your email, and then paste them into document.)
 - Other tools
 - Balsamiq
 - Google drawings
 - Omnigraffle
 - Adobe tools such Photoshop (psds), Illustrator (ai) etc.
 - [A Site Map \(see examples\)](#)
 - **One of the following to represent what your application will actually do:**
 - A list of user stories ([simply a list of sentences in the form of as a <type of user>, I want <some goal> so that <some reason>](#)). A list of user stories is the simplest and is what I did in the exampleProjectSpecs file.
 - A list/spreadsheet of [use cases \(see the end of this article\)](#)
 - A [Use Case Diagram](#)
 - **Which external libraries or ideas do you want to implement?**
 - List of topics
 - A brief description of concept (2-3 sentences each)
 - What is it?
 - Why use it?
 - List of possible candidate modules or solutions
 - An example would be Google Maps integration to list all locations.
